Relative: A2

	B	C	D
2	4	25.00	=B2*C2
3	6	30.00	=B3*C3

Copied down one row, **=B2*C2** becomes **=B3*C3**: the row adjusts, so each row uses its own data. Copied across, the column would adjust too.

Absolute: A2

	B	C
2	100.00	=B2/**B6**
3	250.00	=B3/**B6**
6	1,000.00	Total

Copied down, the relative part changes, but **B6** never does, so every row divides by the same total.

Mixed: $A2 and A$2

	A	B	C
2		5%	10%
3	100	=**$A**3*(1-B**$2**)	=**$A**3*(1-C**$2**)
4	250	=**$A**4*(1-B**$2**)	

$A locks the column of the row labels, and **$2** locks the row of the column headers. One formula fills the whole grid.

Shaded cells hold the copied formula. Values are illustrative.
