C40 | *fx* | =C7*(1+C39)*(C8*(1-C38)*(1-C11)-C9)-C13

	A	B	C	D	E	F
	Rows 1 to 36: the model of the three proposed promotions					
37	**(3) The Furniture promotion: difference in contribution by discount rate (across) and volume lift (down), a data table**					
38	Discount rate (the data table's row input cell)		**10%**			
39	Volume lift (the data table's column input cell)		**0%**			
40	Difference at these inputs		-290,419			
41						
42	**Lift (down) by discount rate (across)**	-290,419	**5%**	**8%**	**10%**	**12%**
43		**0%**	-145,209	-232,335	-290,419	-348,503
44		**5%**	-90,799	-182,281	-243,269	-304,257
45		**10%**	-36,389	-132,228	-196,120	-260,012
46		**15%**	**18,021**	-82,174	-148,970	-215,767
47		**20%**	**72,431**	-32,120	-101,821	-171,521
48		**25%**	**126,841**	**17,934**	-54,671	-127,276
49		**30%**	**181,251**	**67,987**	-7,522	-83,031
50		**35%**	**235,661**	**118,041**	**39,628**	-38,785
51		**40%**	**290,071**	**168,095**	**86,777**	**5,460**
52	**Break-even lift at this rate**		**13.3%**	**23.2%**	**30.8%**	**39.4%**

R3 Customers | **R4 Model** | R4 Budgets

A positive difference: the promotion earns more than it gives up at that discount and lift

The inputs, in blue, are C38 and C39; they sit on this sheet because a data table's input cells must. C40 is the result cell, selected, and B42 repeats it. Every grid cell is the one array formula {=TABLE(C38,C39)}. The shaded cells begin at the first lift above each break-even: 5% at 15%, 8% at 25%, 10% at 35%, 12% at 40%.
