

The join meets each order with its customer and each line with its order, so the customer is carried once for every line.

One square is one order line; each row lines up with its order.

The joined result *(Customer, SalesOrder and SalesOrderLine, joined on the two keys)*

CustomerName	OrderNumber	SalesOrderLineID
Santos-Salazar	SO-2024-000179	703
Santos-Salazar	SO-2024-000841	3231
Santos-Salazar	SO-2024-000841	3232
Santos-Salazar	SO-2024-001070	4147
Santos-Salazar	SO-2024-001070	4148
... 27 more rows		
Santos-Salazar	SO-2026-005787	22153

33
rows in the result

1
customer

Summing line amounts by line is right: each line appears once, so the total is the customer's. **Counting customers by row is wrong:** it finds 33 where there is 1. Count distinct CustomerID, or aggregate at the grain you mean.

Customer 148, Santos-Salazar: 12 orders and 33 lines. The amber cells show the one customer's name repeated once for every line.
