Operating expense, fiscal 2026: from the static budget to the actual

Static budget
The year's operating expense budget, with the commission budget calculated on the budget's sales volume

Volume effect
The commission budget restated at the volume actually billed: Chapter 7's flexible budget on one cost

Classification effect
Depreciation budgeted in Administration, booked partly in Warehouse: one up, one down by the same amount, net 0.00

Remaining variance
The payroll burden rate, budgeted above the actual, and the months with three pay dates

Actual
Operating expense recorded in the ledger, the closes left out

Budget and actual Increase, with a plus sign Decrease, with a minus sign

A sketch of Tutorial 15.2, Step 9, all cost centers together. The vertical axis starts at 6.0M, not at zero, so that the small steps show; the two blue bars are cut near the base. The classification effect moves 101,828.64 up in Warehouse and down in Administration, so it explains none of the total; what remains, 174,758.97 below the budget, is a few percent nearly everywhere.
