

Actual revenue of the quarter forecast

YearQuarter	Revenue
2026-Q4	7,287,187.68

A hindcast. The chart stops in September 2026, so the quarter that follows is already known. The forecast is fit on 33 months, and its three points are compared with the actual 2026-Q4.

Not drawn: the forecast's values. Desktop computes the forecast and its 95 percent interval inside the chart, so no measure and no file can return them. The band marks where they appear; Requirement 3 reads the points from the tooltips.

Report view, page Ex 15.5: the chart that starts in January 2024, from the model answer's two forecast charts (its twin, from February, is not drawn, nor is the page's text box). The date axis is continuous, on the column MonthStart; its labels are drawn in the column's Short Date format. The line is the monthly revenue of the 33 months the chart keeps; the shaded band marks the three months the forecast covers, with no values.
