

- A** Revenue All = **SUM** (SalesInvoiceLine[LineTotal])
- B** Revenue Own = **CALCULATE** (**SUM** (SalesInvoiceLine[LineTotal]))

CustomerID	CustomerName	CustomerSegment	Revenue All	Revenue Own
138	Wright PLC	Strategic	86446845.84	1645084.67
141	Sanchez LLC	Strategic	86446845.84	1460798.32
136	Glenn-Estrada	Strategic	86446845.84	1412934.26

Table: Customer (220 rows)

- A:** the row context alone filters nothing, so SUM adds every invoice line on every row (coral outline).
- B:** CALCULATE turns the current customer into a filter, and the relationship carries it to the lines: each customer's own revenue (teal outline).

Two calculated columns on the Customer table in Table view, sorted by Revenue Own, largest first, with all years of invoice lines. The two columns are left in the General format, without a thousands separator.
