

Version history, in the service	It does not record	A project under version control adds
The model and its data at each saved version	What changed, change by change	Every change, with its author and a message
The last five versions only	A reason, unless someone typed it	A review before a change is merged: Chapter 16's change control
The last person to change each, and a description if one was typed	A review before a change takes effect	
A Pro license to use it		

The three results of the Expected results: the test of Tests.dax for fiscal 2026, before the change, after Revenue sums ListAmount in place of LineTotal, and after the restore. The test reads the measure; the page's cards read the columns, so they do not move. Highlighted: the test after the change, the only place it shows. Below: what a saved version keeps, what it leaves out, and what a project under version control adds. The window of Save to version history and the restore control were not read in the author's test, so the figure draws their effect, not their windows.
