Test	Supports	Contradicts or unexplained	Silent	Independent of the Production Manager and the time clock?	What the test found
Attendance	●			✕ **No**: time clock	All 64 hourly employees present on each of 93 surge days, and on 576 of 652 ordinary days
Punches	●			✕ **No**: time clock	Badge punches on every entry, with meal punches on all 5,952 surge entries; they repeat the clock's own times
Clock-in times		●		✕ **No**: time clock	2.0 different clock-in times a day on surge days against 22.4 on ordinary days; 33 employees share one
Roster against clock		●		✕ **No**: Production Manager and time clock	Rostered 8 hours, clocked 12.5: roster equals clock on 0 of 5,952 surge entries
Overtime approvals		●		✕ **No**: Production Manager	1,475 of 5,952 surge approvals cite an operation, all already ended; all approved by the Production Manager
Planned load		●		– **Not established**: outside the clock	Surge weeks 0.58 of capacity against 0.61 for others in 2026; yet 2 surge weeks and 9 work-center weeks over it
Calendar		●		– **Not established**: outside the clock	Every surge day is a working day; 6 had maintenance and 21 reduced capacity at a work center
Output		●		– **Not established**: outside the clock	Surge weeks completed 0.55 standard hours per hour clocked against 0.70; the following weeks completed less
Absences			●	– **Nothing to grade**	None recorded in Manufacturing in any year

Every record that agrees with the hours comes from the time clock. The three records outside it (the capacity plan, the calendar and the output) do not support the hours as recorded, and the records do not show who keeps them, so their independence from the Production Manager is not established. Absences are silent. The hours are unsupported, not unworked. Output is from Requirement 3's weekly comparison.
