B30 | *fx* | =ProductsConversion+UnusedCost-Inputs1090

	A	B
	Rows 1 to 21: the committed cost, the time-driven rate and the Factory Overhead entries per standard hour	
22	**Products and unused capacity, reconciled to the inputs to 1090**	
23	Routing time used (Activities)	73,822.90
24	Products' conversion: routing time at the time-driven rate, plus the Factory Overhead entries	4,259,206.41
25	Unused capacity: practical hours not used	29,243.70
26	Unused capacity cost, a cost of the plant (not of the products)	1,168,726.42
27	of which the crew	997,573.76
28	Products plus unused capacity	**5,427,932.83**
29	Inputs to 1090 (Cost Behavior)	5,427,932.83
30	Difference	**0.00**
31	The item costs, applied to the year's completions: setup hours the work orders ran (Activities)	4,910.11
32	setup hours the item costs assign (setup over the family's average batch)	4,902.97
33	the item costs' conversion on the year's completions	4,258,921.01
34	setup-allocation difference: the setup hours the average batch leaves out, at the time-driven rate	285.41
35	item costs' conversion, plus the setup difference, plus unused capacity	5,427,932.83
36	difference from the inputs to 1090	**0.00**
	Rows 37 to 101: the family summary, the top fifth of the items and the Data Table of practical capacity	

Activities | **Costs** | Make or Buy

Outlined in teal: the products' conversion and the unused capacity cost, the two parts of the inputs to 1090. Outlined in coral: the two differences, both zero: products plus unused capacity against the inputs (B30, whose formula is in the bar) and, after the setup-allocation bridge in rows 31 to 34, the item costs' conversion plus the setup difference plus the unused capacity against the same inputs. Column A is widened here to show each label on one line; in the workbook a long label wraps within the column.
