

Reshaping (Power Query, a PivotTable) changes the layout. With one value for each cost center and month, as here, every amount stays as it is, but a PivotTable adds up repeated keys, so check the keys and the totals before treating a pivot as a reshape. Correcting a value changes the data and leaves the layout as it is. A dataset can need either, both or neither.

Amounts: the Charles River salaries budgets of three cost centers, fiscal 2025, as in Figure 2.6. The wrong amount is the same amount with its last two whole-number digits swapped, added for the illustration; it is not in the data.
