
Is it the column chosen to identify each row of its own table?
Yes
Primary key
identifies each row of its own table
No
Does a type column in the same row say which table its value refers to?
Yes
The source-document trace
read the two columns together; not one foreign key
No
Does each filled-in value refer to a row of one fixed table, its own included?
Yes
Foreign key
a logical link in Charles River, tested rather than declared
then ask
Which table does it refer to?
its own table
Self-reference
a foreign key to its own table
another group
Bridge key
a foreign key into another table group
No
An ordinary column
it describes the row
SalesOrder
PK SalesOrderID
A column can play more than one role: CustomerID is also the key of Customer.
GLEntry
SourceDocumentType
SourceDocumentID
SalesOrder
FK CustomerID
Neither: an ordinary foreign key, inside its own table group.
Account
FK ParentAccountID
Employee.ManagerID is another.
SalesOrderLine
FK ItemID
ItemID in SalesOrderLine reaches Item, in Master Data.
SalesOrder
OrderDate
OrderNumber
OrderNumber is unique, but it is not the key the table uses, so it is an ordinary column.
A question to ask of the column
The role it plays
