Ask, from the top		What the reviewer does	An example from the register
1. Is it expected every period?	yes	**Set aside.** Record the disposition and the evidence once, then check at each refresh that it recurs	The 6 year-end closing entries, two a year, that exceed every approver's limit (JE AboveLimit): disposition Expected
no			
2. Does it recur because of the way a control is designed?	yes	**Set aside.** Report one finding, change the control, and the exceptions should stop	The 77 registers approved by the employee they pay (PR SelfApproved), one or more in every month
no			
3. Does one document fail several tests?	yes	**Use the score as a first cue.** Materiality, age and urgency can override it	JE-2024-000001, the opening entry: 4 tests. 18 other documents fail two each
no			
4. Is it new this month?	yes	**Review next.** It arrives with no disposition	None in December 2026: its 4 exceptions are 2 closes and 2 recurring registers
no			
5. Everything else	then	**Review by amount and age.** The larger and the older first	22 open exceptions on one test each; the largest, JE-2026-000115, $210,000.00; the oldest, JE-2024-000003, 2024-01-01

A sketch of the order the chapter gives: the expected and the recurring exceptions are dealt with once, as groups; what remains is reviewed by the number of tests failed, then by novelty, then by amount and age. This is a teaching order, not Li and colleagues' adaptive suspicion score, and a serious single exception may need priority. A question answered yes sends the exception to its action box; no sends it down. The examples, counts and amounts are read from the register.
